

# Extract Consensus

The workflow sample, described below, allows one to extract consensus from multiple assemblies at the same time. Either a simple default or SAMtools algorithm can be used to extract the sequences.

## How to Use This Sample

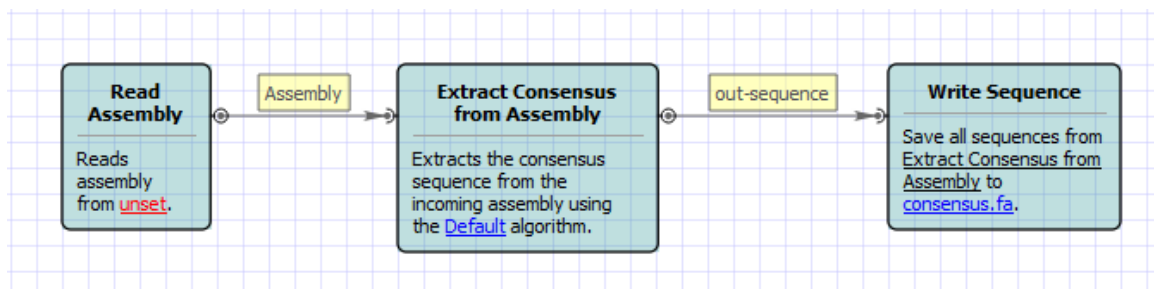

If you haven't used the workflow samples in UGENE before, look at the "[How to Use Sample Workflows](#)" section of the documentation.

## Workflow Sample Location

The workflow sample "Extract consensus" can be found in the "NGS" section of the Workflow Designer samples. Don't be confused by another sample with the similar name that extracts consensus from multiple alignments!

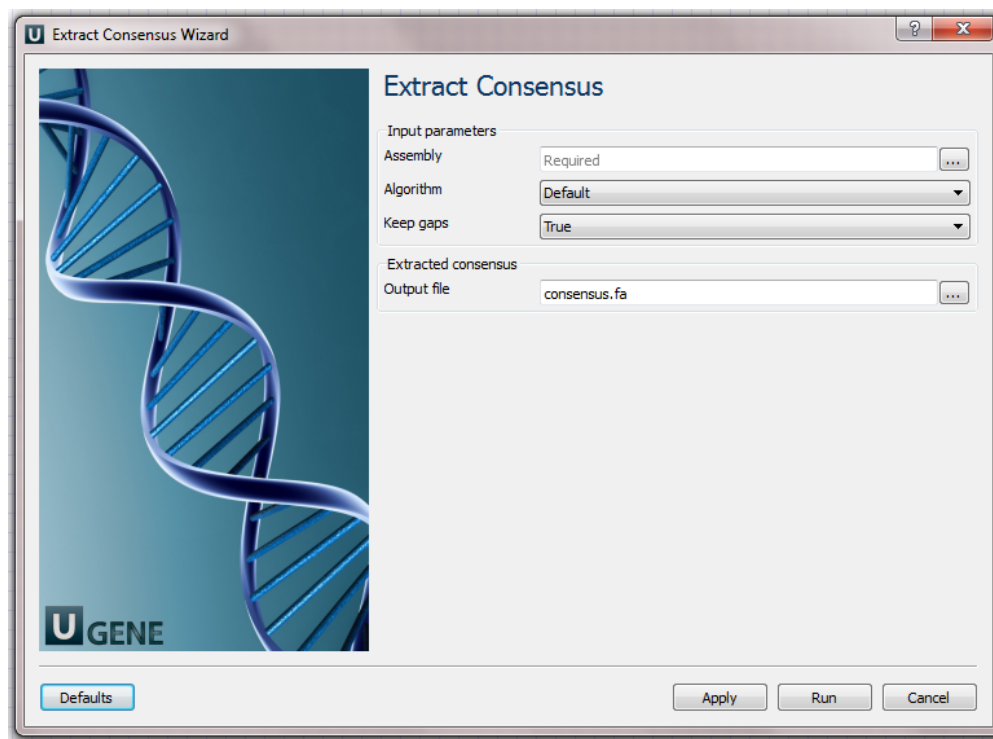

## Workflow Image

The opened workflow looks as follows:

## Workflow Wizard

The wizard has one page.

It is required to input at least one NGS assembly to this workflow. Different assemblies must be separated by a semicolon (;).

Other options can also be modified, if required:

- By default, the workflow uses a simple algorithm to calculate the consensus that uses A, C, G, T alphabet. Alternatively, one can select a more sophisticated [SAMtools](#) algorithm to calculate the consensus.
- "Keep gaps" parameter specifies whether a gap should be inserted into a sequence when there were no mapped reads in this location.

- The output file is called "consensus.fa" by default. If several assemblies were provided as input this file contains consensus for all of them (i.e. the output file is a multi-fasta).

## Workflow Result

The workflow output file is shown in the dashboard as follows:

The screenshot shows the UGENE Workflow Designer interface for the 'Extract consensus' workflow. The dashboard is divided into several sections:

- Output Files:** A table showing the output file 'consensus.fa' produced by the 'Write Sequence' task.
- Workflow Task:** A section showing the task name 'Extract consensus 1', a time display 'Time: 00:00:01', a blue progress bar, and a green message box stating 'The workflow task has been finished successfully!'.
- Common Statistics:** A table summarizing the workflow elements, their elapsed times, and the number of output messages.

File	Producer
consensus.fa	Write Sequence

Element	Elapsed time	Output messages
Extract Consensus from Asse.	00:00:00	1
Read Assembly	00:00:00	1
Write Sequence	00:00:00	0
