Installation on Linux

- Download the appropriate version of the installation package (32-bit or 64-bit). The downloaded le has *.tar.gz extension:

Universal binary packages:

- Download 32-bit <u>Standard</u> or <u>Full</u> package
- Download 64-bit <u>Standard</u> or <u>Full</u> package
- Download 64-bit <u>NGS</u> package (*caution: package size is about 4Gb*)

- Unpack the archive. You can use this command:

```
tar -xf [name of the downloaded *.tar.gz file]
```

- Change the working directory to the unpacked UGENE directory:

```
cd [name of the unpacked directory]
```

- Launch the UGENE GUI version using the command:

```
./ugene -ui
```

or the command line version using the command:

```
./ugene
```

> ⚠ Several native packages for specic Linux distributions are also available. UGENE is a part of Ubuntu and Fedora Linux distributions. See the next chapter.

- Native Installation on Ubuntu
- Native Installation on Fedora
